

ABSTRACT

Cutting apparatus is provided which includes clamping apparatus with two clamping members movable between a clamped position, wherein a portion of the saw blade is secured in position in use, and an unclamped position, wherein the saw blade is movable with respect to the clamping members. The apparatus is attached to or is integrally formed with shaft means which are substantially circular in cross section. The apparatus also includes the ability for user selection to operate the apparatus as a jigsaw or a scroller by operation of a locking mechanism.
